## COMPRESSIVE IMPLANTS

The COMPRESSIVE implant is a one-piece implant with compressive threads. It is used for multiple unit restorations with immediate loading in the upper and lower jaws with adequate bone tissue. It can be used in combination with basal implants and allows flap and flapless placement. Abutment direction can be adjusted up to 15° relative to the implant axis.

Special compressive threads  
Immediate loading  
Adjustable abutment slope angle

### Bendable neck

Depending on the length of the implant the abutment can be bent up to 15 degrees, as long as the implant is placed with high primary stability.

Polished surface protects from accumulation of bacteria at the cervical part of the implant.

### Compressive Implants
